ACKNOWLEDGMENTS

The authors would like to acknowledge Susan C. Thollaug for the initial programming for this report for the 1991-1993 period. We would also like to thank Valerie Wellin and Peter R. Summers and for their assistance in critiquing the report throughout the years as well as Anna Burdin, Cassandra Crawford, Cynthia Mercado-Scott, Dr. Martin Kitchener, and Terrence Ng for their assistance over the years.

In past years, this research was funded in part by the AARP Public Policy Institute, the Service Employees International Union, the U.S. Health Care Financing Administration #18-C-90034 and The Agency for Health Care Policy & Research #H500-97-0002

STATE DATA ON NURSING FACILITIES, STAFFING, RESIDENTS, AND FACILITY DEFICIENCIES, 2001 THROUGH 2007

Introduction

The large state and federal expenditures for freestanding nursing facilities (estimated to be \$144 billion in 2009) have drawn the attention of policy makers and researchers to understand the nursing home industry (Truffer et al., 2010). The demand for nursing home beds is growing with the aging of the population and many other factors. As the need for care grows, the nation's nursing facilities are an increasing subject of concern. The specific characteristics of the facilities, staff, and residents are of critical importance to the delivery of nursing home care.

The quality of care provided in nursing homes has long been a matter of great concern to consumers, professionals, and policy-makers. Because of the growing concern about nursing home quality, Congress requested a study by the Institute of Medicine (IOM). The IOM's Study on Nursing Home Regulation (1986) and other studies reported widespread quality of care problems and recommended the strengthening of federal regulations for nursing homes (US GAO, 1987; US Senate, 1986; Zimmerman et al., 1985). The IOM Committee recommendations and the active efforts of many consumer advocates resulted in Congress passing Nursing Home Reform Legislation (OBRA, 1987).

Major changes were made by the Health Care Financing Administration (HCFA) (now called the Centers for Medicare and Medicaid Services) (CMS) in the federal survey reports and the enforcement procedures in July 1995.

The OBRA 1987, implemented by HCFA regulations in 1990 and in 1992, mandated a number of changes. First, the regulations eliminated the priority hierarchy of conditions, standards, and elements that were in the prior regulations. Second, comprehensive assessments of all nursing home residents were mandated to determine the functional, cognitive, and affective levels of residents that must be used in the care planning process (Morris et al., 1990). Third, more specific requirements for nursing, medical and psychosocial services were designed to attain and maintain the highest possible mental and physical functional status by focusing on outcomes (such as incontinence, immobility, and decubitus ulcers). Regulations detailing and protecting residents' rights were added.

One valuable source of data on nursing facilities and the quality of care in these facilities is from the On-line Survey, Certification, and Reporting system (OSCAR). The OSCAR system has information from the state surveys of all (about 16,500) certified nursing facilities in the U.S., which are entered into a uniform, computerized database.

Purpose of the Data Book

This book presents calendar year data on nursing facilities, staffing, resident characteristics, and surveyor reports of quality deficiencies by state. These OSCAR data are from surveys collected by state agency surveyors on nursing facilities during the federal certification process during the calendar year.

The report presents a description of facility characteristics. Detailed summaries about the type of certification, bed size, occupancy, ownership, hospital-based and chain affiliations and other facility characteristics are presented.

Resident characteristics are shown as reported by the nursing facilities. These include activities of daily living (ADLs), restraints, incontinence, psychological problems, and other special care needs of residents.

Nurse staffing (RNs, LVNs, and NAs) hours per resident day are presented for nursing facilities. These data are reported by facilities for a two-week period prior to when the state survey was conducted. The data are the only major source of information for all facilities on staffing levels.

Finally, data are presented on facility deficiencies based on state surveyor evaluations of the process and outcomes of care in the facilities. Deficiency data are presented for the 17 major areas used in the survey process: (1) resident rights; (2) admission, transfer and discharge rights; (3) resident behavior

and facility practices; (4) quality of life; (5) resident assessment; (6) quality of care; (7) nursing services; (8) dietary services; (9) physician services; (10) rehabilitation services; (11) dental services; (12) pharmacy services; (13) infection control; (14) physical environment; (15) administration; (16) laboratory services; and (17) other. The information compiled shows differences in the frequency of the deficiencies by type and category.

It should be noted that this report does not describe life safety code violations. A report by the General Accounting Office US GAO (2004) found that deaths of residents in nursing home fires pointed out the weaknesses in the federal fire safety standards and the federal oversight of nursing home fire safety is not effective.

In order to use the OSCAR data for this report, the researchers have undertaken a process to prepare the data. Certain decision rules were developed to use different components of the data. Technical issues are described in detail in the Appendix.

Earlier versions of this report included only deficiencies from the annual licensing and certification surveys. In 2009, the report was revised to include deficiencies from both the annual surveys and complaint investigations. The report findings were then revised to show all deficiencies for each year from 2004 through 2009.

Background on the Survey System and Data Collection

Every facility must have an initial survey to verify compliance with all federal regulatory requirements in order to be certified. Certified facilities are resurveyed annually in order to continue certification. States are required to survey each facility no less often than every 15 months, and the state average for all facilities is about every 12 months. Follow-up surveys may be conducted to assure that facilities correct identified deficiencies. In addition, surveys are required when there are substantial changes in a facility's organization and management. Finally, surveys may be conducted to follow-up a complaint that alleges substandard care.

OSCAR data are collected in two different ways. First, the facility characteristics, resident characteristics, and staffing levels are completed on standardized forms by individual nursing homes at the beginning of each survey and are certified by the facility as being accurate. The data are provided to the state surveyors on the appropriate forms as the state begins the survey process. During the survey, state surveyors review the data and conduct checks by comparing the facility report with individual resident medical records, staffing records, and observations of residents. After the review of the survey data, state staff enter the data into a computerized on-line OSCAR data base from written forms.

Second, state surveyors make decisions regarding whether the facility has met or not met each standard after the facility survey has been completed. If a facility is judged to not meet a standard, the facility is given a deficiency and OSCAR reports that the standard was NOT MET.

The survey evaluations are based upon data from a combination of sources including, but not limited to, the assessment of a selected sample of individual residents; interviews with a sample of residents, family members and staff; a review of the resident records and facility documents; and other data. After these judgments are made, the state surveyors record and enter the data for each item for each facility into the on-line OSCAR data system. Thus, the determinations of deficiencies are made by state surveyors independently of the facility, with standard forms, sampling and survey procedures to ensure accuracy. Team members and state supervisors subsequently review state surveyor deficiencies. Facilities have the option to challenge and appeal decisions through an administrative review process.

Because of these checks in the system, the likelihood of false positive deficiencies is low, and errors tend to be in under-reporting of failures to meet standards (US GAO, 1998). Thus, a note of caution is needed that under-reporting of deficiencies is more likely to be a problem than over-reporting.

CMS Procedures and State Survey Variation

CMS is the Centers for Medicare & Medicaid Services, formerly known as the Health Care Financing Administration (HCFA). CMS uses "front-end" edit screens to ensure the accuracy of the OSCAR data. State staff enter the data for each survey item into the OSCAR data set within 45 days of each survey. Some "front-end edit" checks are established in the OSCAR program for entering the data for each component of the survey to identify entry errors. This computerized edit system has resolved many data problems. Beyond this, the regional offices conduct reviews of OSCAR data from each state survey.

One concern about the OSCAR data has been with the survey procedures and the inter-survey reliability (both across states and within states) in judging the quality of facilities (IOM, 1986; US GAO 1988). This issue has been addressed in part by the implementation of the 1990 federal survey procedures. First, the procedures require accuracy checks by surveyors to determine whether facilities are conducting comprehensive assessments of residents and whether or not these assessments are accurate and appropriately used in the care planning process. The federal regulations and survey forms have improved the sampling procedures and survey methods used by the survey teams. The federal procedures require state surveyors to use a stratified random sample of residents for in-depth reviews and to conduct face-to-face resident assessments, closed record reviews, and individual and group structured

interviews. These changes were designed to improve the reliability of the survey process and the data reported on OSCAR and to make surveys more oriented toward the residents. Moreover, CMS has provided extensive new federal training for state surveyors.

In addition, the Health Care Standards and Quality Bureau of CMS, using federal survey teams from the regional offices, conducts periodic oversight surveys. In the past, Federal staff resurveyed the same facilities within 60 days of the state survey for a sample of facilities. Regional CMS offices developed a survey concurrence index for key survey components (from OSCAR) for each state. This annual concurrence index becomes a part of the federal monitoring criteria along with other components conducted by CMS. States that fall below the concurrence standards established by CMS are critiqued and monitored by CMS. Using the procedures since July 1995, federal surveyors may accompany state surveyors on a selected number of surveys to observe the surveys.

Even though CMS has made efforts to standardize the reporting of deficiencies by state survey staff, some regional variations may exist. Different states may vary their survey procedures, training efforts, and enforcement stringency (US GAO, 1998; 1999a,b,c; USOIG, 1993; 1999; 2004). A national evaluation of the certification survey processes of nursing facilities conducted by HCFA (1998) also found variations in the survey procedures. Moreover, the enforcement procedures also vary across states (Harrington et al., 1999; 2004; 2009). In spite of the improvements that

have been made, the IOM (2001) recommended that there was a need to improve both the state survey process and the enforcement system and made specific recommendations for improvements.

Many studies continue to document the serious quality problems related to the ongoing problems with the federal and state survey and enforcement system including the complaint investigation process (U.S. Government Accountability Office [GAO], 2007, 2009, 2009).

Staff turnover and recruitment problems and fiscal problems at the state agency level may hamper survey and enforcement efforts (USOIG, 1993; US

GAO, 2000; 2004; Walshe and Harrington, 2002; Harrington and Swan, 2004; US CMS 2001).

Users of this report should consider that it is difficult to distinguish between real differences in the quality of care in facilities and differences in survey and enforcement procedures across states. It is hoped that this report will be useful to consumers, nursing facilities, researchers, and policy makers to understand trends over time and across states.

FACILITY CHARACTERISTICS

Background

Facility characteristics are important. The most important feature of a facility is the number of beds that are certified for Medicare and Medicaid residents. The size of the facility determines the number of residents who can be admitted.

Occupancy rates are important in showing the potential availability of beds and such occupancy rates influence the financial status of the facility. Occupancy rates have begun to decline so there is some evidence of an excess supply of nursing home beds in many areas (Grabowski and Angelelli, 2004).

The percentage of Medicare and Medicaid patients in a facility is an important factor. Nursing homes have historically considered Medicaid reimbursement rates to be low and prefer private pay patients (Swan et al., 2000; 2001a,b). Higher Medicaid reimbursement rates have been associated with higher staffing and higher quality (Grabowski, 2001).

One of the major debates in research circles is whether the proprietary nature of the nursing home industry affects process and outcomes in terms of quality of care. A review of the research studies regarding ownership and quality shows a for-profit facilities generally have been reported to have lower overall quality of care but some studies have had mixed results (Comondore et al. 2009). Harrington et al. (2000a,b) showed higher deficiencies in for-profit facilities than non-profit and government

facilities. Thus, proprietary ownership and chains may be associated with lower staffing levels and poorer process and outcome measures.

Hospital-based nursing homes may have higher quality of care because they have more Medicare patients, have higher staffing levels, and/or are more likely to be non-profit in ownership (Harrington et al., 2000a,b).

Having accreditation may be positively associated with higher staffing levels and with higher quality of care. The existence of dedicated special care units, such as those for persons with Alzheimer's disease, may also be associated with higher quality of care because of higher staffing levels.

Large size facilities have been associated with lower quality although findings are mixed (Harrington et al., 2000a,b). Larger facilities tend to have lower staffing and perhaps have more difficulty in managing the quality of care.

Those facilities with organized residents groups or organized family groups may have higher quality of care. Facilities with the capacity to conduct research may also be expected to have higher quality of care.

The following section presents data from OSCAR to describe certified nursing facilities in the U.S.: beds by certification types (Medicare, Medicaid, or both), occupancy rate (number of

residents divided by total number of beds), ownership (non-profit religious, non-profit private, non-profit other, proprietary, or government), owned or leased by a multi-facility organization

(chain), and hospital-based facility (yes or no). The number of beds in special care units, organized resident group, and organized family member group were also reported.

FINDINGS

FACILITY CHARACTERISTICS

Total Number of Certified Nursing Facilities Surveyed by Calendar Year

Table 1 shows the total number of certified nursing facilities surveyed in the U.S. by calendar year. There were 15,138 certified nursing facilities surveyed in 2004 and 15,658 surveyed in 2009 out of approximately 16,500 certified facilities. Not all facilities are surveyed by state agencies during a calendar year.

Average Number of Certified Beds per Nursing Facility

The number of certified nursing beds per facility is calculated by dividing the total number of certified beds in a state by the total number of certified facilities in the state. Table 3 shows the overall average size was 107.40 beds in 2004 and the average increased to 108.42 beds per facility in 2009.

Number of Nursing Facility Residents

Table 4 reports the total number of nursing facility residents in certified nursing facilities surveyed in each state during a calendar year. There were 1,393,127 residents in certified nursing facilities that were surveyed in 2009. These data exclude residents in uncertified beds. The data generally show a slight increase in the number of residents in certified beds between 2004 and 2009.

Average Occupancy Rates

Table 4 shows that the average certified nursing facility occupancy rate for the U.S. was 85.52 percent in 2004. Facility occupancy rates are calculated by dividing the number of nursing residents in a certified facility by the total number of certified beds (excluding all uncertified residents and beds). The occupancy rates declined to 83.72 percent in 2009.

Facility Beds by Certification Category

Licensed nursing facilities may apply to be certified for participation in the Medicare and/or Medicaid program on a voluntary basis. Facilities may apply to participate in: (1) the Medicaid only (Title 19) program, (2) the Medicare only (Title 18) program, or (3) in the Medicare/Medicaid dually certified (Title 18 and 19) program. Since 1991, the Medicare program classified facilities as skilled nursing facilities (SNFs) while the Medicaid-certified facilities are designated as "nursing facilities" (NFs). Certification requirements are detailed in the federal regulations 42 CFR 483. Federal Medicare certification allows for all or part of a facility to be certified.

Table 5 shows the percent of certified nursing facility beds for each program. The number of beds certified for Medicare-only were 2.1 percent and 2.25 percent of the total beds in both 2004 and 2009, respectively. Medicaid-only certified beds declined from 4.80 percent in 2004 to 2.80 percent in 2009. Dually certified beds increased to make up the difference.

Residents by Payer Source

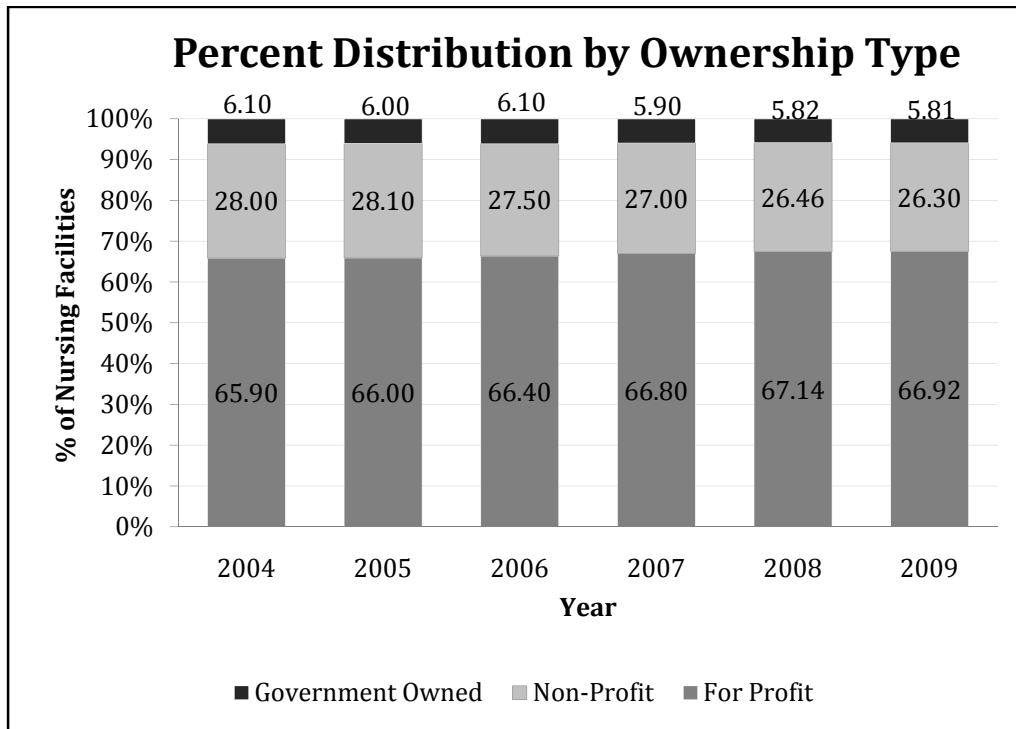

The percent of certified nursing facility residents by primary payer source is shown in Table 6. The percentage of total residents primarily paid for by Medicaid declined from 65.70 to 63.67 percent of the total residents in the 2004-2009 period. Medicare paid for 14.17 percent of the total residents in 2009, increasing from 12.20 percent in 2004. Private payers and other sources have remained the same (22.0 percent in 2004 and 22.16 percent in 2009). Even though most nursing facility beds are dually certified for either Medicare or Medicaid residents, the care for most residents is paid for by Medicaid.

Distribution of Facilities by Ownership Type

Nursing facility ownership patterns were fairly stable in the 2004-2009 period, when the large majority of nursing facilities were proprietary. Table 7 shows that 66.92 percent of the surveyed facilities were for-profit facilities while non-profit facilities were 26.30 percent and government owned facilities were 5.81 percent in 2009. For profit homes increased slightly while non-profit and government facilities declined since 2004.

Ownership patterns vary widely across states. Wyoming and Alaska have a high percentage of government owned facilities. North Dakota, South Dakota, and Minnesota have a high percentage of non-profit facilities. Oklahoma, Texas, Arkansas, Alabama, Utah, and Oregon have the highest percentages of proprietary facilities.

Facilities by Affiliation

Table 8 shows the percent of facilities that were owned or leased by multi-facility organizations (chains that have two or more facilities). The percentage that were owned or leased by chains was 52.5 percent in 2004 and increased to 54.08 percent in 2009 (3 percent).

Table 8 shows that certified hospital-based facilities that were surveyed decreased from 9.2 percent in 2004 declined to 6.97 percent of all facilities in 2009, 24 percent. These changes occurred after the introduction of the Medicare prospective payment system for nursing facilities in 1998.

Special Care Beds

Surveyed facilities reported the number of beds available in dedicated special care units. Table 9 shows the number of beds in special care units for Alzheimer's, AIDS and hospice for 2004 through 2009. The total number of beds dedicated to Alzheimer's was 82,784 in 2009, a decline of 6 percent since 2004. These special care beds were 5 percent of the total certified beds in the U.S surveyed in 2009.

The number of dedicated AIDS beds declined from 1,390 in 2004 to 874 in 2009. The number of hospice beds declined from 2,627 to 2,590 in 2009. Many nursing facilities offer care to Alzheimer's, AIDS and to hospice residents outside of special care units.

Special Care Beds (continued)

Table 10 shows that there were 15,030 rehabilitation beds in special units surveyed in certified nursing facilities in the U.S. in 2009. The number of rehabilitation beds increased by 8 percent. This was less than one percent of the total certified nursing facility beds in the U.S. in 2009. There were 7,387 ventilator beds reported in special units in 2009, and these beds had increased by 20 percent over 2004. There were 1,231 dialysis unit beds surveyed in 2009.

It should be noted that many nursing facilities accept residents with special needs but do not maintain separate units for such residents.

Resident Groups/ Family Groups

Facilities may have an organized group of residents who meet regularly to discuss and offer suggestions about policies and procedures affecting residents' care, treatment, and quality of life; to support each other; to plan resident and family activities; to participate in educational activities or for any other purposes. Table 11 shows that the percent of facilities with resident groups increased from 95.0 percent in 2004 to 95.77 percent in 2009.

Facilities may have organized groups of family members who meet regularly to discuss issues about residents' care, treatment, and quality of life. Table 11 shows that approximately 41.3 percent of facilities reported family groups in 2004, but this decreased to 33.97 percent by 2009.

RESIDENT CHARACTERISTICS

Background

Nursing facilities vary in the type of residents they serve. Resident characteristics affect the environment of the facility. Moreover, the special characteristics of nursing facility residents require different levels and types of staff resources and affect the facility's success in providing high quality care. A number of nursing facility resident classification systems have been developed and are often referred to as "case mix" indicators.

The resource utilization group system (RUGS-II) was the most well established case mix approach tested which as for reliability and validity (Fries and Cooney, 1985; Schneider et al., 1988; Fries et al., 1989). RUGS II was developed from a study of Medicaid nursing home residents in New York and consists of 16 groups which are first divided into five categories: special care, rehabilitation, clinically complex, severe behavioral problems, and reduced physical functioning. Subgroups are formed under each of these categories by degree of dependency in activities of daily living (ADL). RUGS III is the latest version developed for the current HCFA Nursing Home Case Mix demonstration project (Fries et al. 1994).

The OSCAR report has summary data on residents at the facility level describing resident's need for assistance with activities of daily living (ADL). Although interesting, such data are difficult to understand unless they are summarized in some way. Two types of summary data are presented. First, a

simple summary of three major activities of daily living (ADLs) was compiled. The facilities were asked to rate each resident's ADLs on a scale of 1 to 3 from needs little or no assistance to needs extensive assistance. The three ADL scores were for those residents who needed assistance in: (1) eating, (2) toileting, and (3) transferring. A score of 1 was assigned to residents who were independent. A score of 2 was assigned to those that needed some supervision. A score of 3 was assigned to those who were dependent.

Each ADL score was multiplied by the number of residents in that category for each facility. An average composite score was developed by adding each of the three scores together and dividing by the total number of residents in the facility to compute each facility's index score. Thus, a summary case mix score ranging from 3-9 was compiled for each facility based on resident ADL characteristics. Individual facility scores were then summarized for each state. Because of reporting changes by HCFA, data for the earlier years could not be computed for this report.

The second approach used was based upon a composite case mix index for nursing facilities. This approach was developed by Thoms (1975) and used by a number of researchers including Cowles (Health Data Associates 1994). This approach constructed a casemix score by multiplying the proportion of residents with selected ADL limitations and selected patient problems times the

estimated number of management minutes required for care of those selected problems, developed from a study of service requirements by Thoms (1975). Thus, a weighted score was multiplied by the percentage of residents in various categories as follows: completely bedfast times 46; needing assistance with ambulation times 32; needing full eating assistance times 45; needing some eating assistance times 20; having an indwelling catheter times 20; incontinent times 48; having decubitus ulcers times 20; receiving bowel or bladder retraining times 26; and receiving special skin care times 10. Thus, an index was constructed for each

facility and then summarized to develop an average resident acuity at the state level.

In addition, the following characteristics show the type of more advanced care that residents receive: percent of clients receiving special treatments (injections, ostomy care, IV feedings, tube feedings, or suctioning), and percentage with organic psychiatric or other psychiatric conditions. Other characteristics that may be important are the percentage who receive psychotropic drugs and who have pressure ulcers, contractures, incontinence, and catheters.

FINDINGS

RESIDENT CHARACTERISTICS AND SERVICES PROVIDED

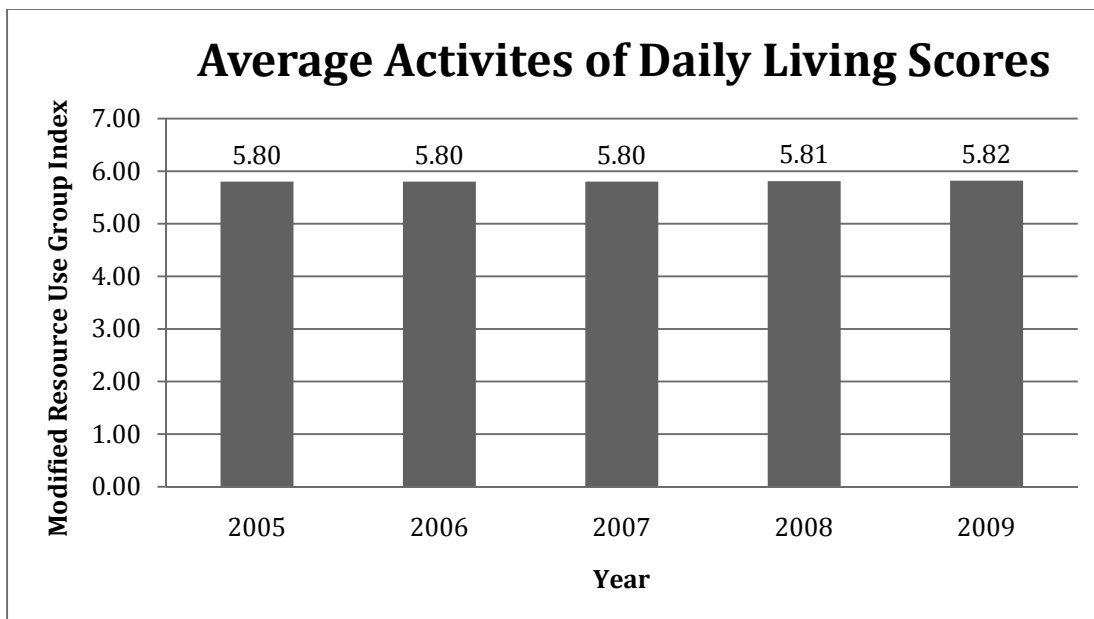

Assistance with Activities of Daily Living

Table 12 shows the average score for residents needing assistance with eating in facilities by state. Each state has an average score from 1 to 3 in terms of the need for assistance with eating, where 1 indicates the lowest need and 3 the greatest need for assistance. The U.S. average resident need for eating assistance was 1.7 for all facilities surveyed in 2005, and was 1.66 in 2009.

The average score for residents needing assistance in toileting is shown in Table 12. The U.S. average resident need for toileting assistance was 2.1 in 2005, and 2.12 in 2009.

Finally, the need for resident assistance with transferring from surfaces such as to and from the bed, chair, wheelchair or to and from a standing position is shown in Table 12. The average resident need was 2.0 for transferring in 2005, and 2.04 in 2009.

Table 12 also shows the average summary scores for these three activities of daily living for all facilities in each state. The average resident need score for eating, toileting, and transferring for all facilities surveyed in the U.S. was 5.80 in 2005, and 5.82 in 2009. The summary scores on a three-point scale show some variation across states.

Summary Resident Acuity Index

Table 13 shows the average summary score for resident acuity using the management minute approach. This index is based on a compilation of resident characteristics including being bedfast, needing assistance with ambulation, needing full eating assistance, needing some eating assistance, having an indwelling catheter, being incontinent, having a pressure ulcer, receiving bowel or bladder retraining, and receiving special skin care. Each of these characteristics were weighted by the average amount of management minutes or the time needed to provide nursing care.

The average index was 103.10 in 2004 which declined to 96.74 in 2009 for all facilities surveyed in the U.S. This index allows for comparisons of acuity differences in facilities across states, which ranged from 73.07 in Iowa to 123.49 in Hawaii in 2009. This shows a wide variation in levels across states.

Residents Who Are Bedfast or Chair Bound

Table 14 shows the percent of total residents who were bedfast in the 2004 to 2009 period. This includes residents who were in a bed or recliner for 22 or more hours per day in the week before the survey. The percent of bedfast residents decreased from 4.30 in 2004 to 3.72 in 2009 for all facilities surveyed. In 2009, the average percent of bedfast residents ranged from 0.73 percent in South Dakota to 7.85 percent in Louisiana.

A number of residents depend on a chair for mobility or are unable to walk without extensive or constant support from others. The percent of total residents who were chair bound averaged from 54.00 to 57.24 percent in the U.S. in 2004-2009 (See Table 14). The percent of chair bound residents ranged from 40.00 percent in Rhode Island to 65.36 percent in Washington in 2009.

Contractures

Contractures, which are restrictions in full range of motion of any joint due to deformity, disuse and pain, are common problems of nursing facility residents. In 2004, 29.20 percent of residents were reported as having contractures and this decreased to 28.56 percent in all facilities surveyed in 2009 (See Table 15). The average percentage reported ranged from 15.63 percent in Connecticut facilities to 56.36 percent in Alaska in 2009.

Physical Restraints

Physical restraints include physical or mechanical devices, material or equipment, which cannot be easily removed by residents, to restrict freedom of movement or normal access to one's own body. In 2004, 7.50 percent of facilities reported using such restraints but this declined to 3.49 percent in all facilities surveyed in 2009 (See Table 15). The reduction may have been related to regulations and training about the negative effects of restraints on residents. The average percentage in 2009 ranged from 0.81 percent in Kansas to 7.68 in Louisiana.

Psychoactive Drugs

The percent of residents receiving psychoactive medications is reported in Table 16. Such drugs include anti-depressants, anti-anxiety drugs, sedatives and hypnotics, and anti-psychotics. In 2004, 63.20 percent of residents in facilities in the U.S. were reported to be receiving such medications. This usage increased to 65.44 percent in 2009; specifically, these percentages ranged from 40.42 percent in Hawaii to 74.26 percent in Tennessee. The increase is somewhat surprising because federal regulations prohibit the use of anti-psychotics and other psychoactive drugs unless such drugs are shown to be necessary for particular resident problems. On the other hand, anti-depressants are sometimes under-prescribed and new educational efforts are focused on the appropriate use of anti-depressants.

Mental Retardation/Developmental Disabilities

New federal regulations from OBRA 1987 require screening of all new residents to ensure that those who are mentally retarded, developmentally disabled, or mentally disabled are placed in appropriate facilities where they receive services designed to meet their needs. State officials are required to certify that those individuals with mental retardation who are placed in nursing facilities are receiving appropriate services. The percent of residents with developmental disability was reported. This includes residents who have mild to profound mental retardation. Table 16 shows that 2.50 to 2.86 percent of residents were reported to have developmental disabilities in 2004 and in 2009.

Dementia & Other Psychological Diagnoses

Table 17 shows the percent of residents that were reported by facilities and states with having a dementia diagnosis. The average percent of residents reported with dementia increased from 45 percent in 2004 to 46.21 percent in 2009. The percent varied from 39.54 percent in Montana to 56.26 percent in Maine in 2009.

The percent of residents with other psychiatric conditions such as schizophrenia, mood disorders, and other problems is reported in Table 17. Other psychiatric conditions increased from 19.1 percent of residents in 2004 to 23.49 percent in 2009. The percentage of conditions varied from 5.27 percent in Hawaii to 34.68 percent in West Virginia in 2009.

Pressure Sores and Skin Care

Pressure ulcers (or bedsores) are areas of the skin and underlying tissues which erode as a result of pressure or friction and/or lack of blood supply. The severity of the ulcer ranges from persistent skin redness (without a break in the skin) to large open lesions which can expose skin tissue and bone. Table 18 shows the percent of residents in facilities with pressure sores declined from 7.6 percent in 2004 to 6.51 percent in 2009. The percent ranged from 4.2 percent in North Dakota to 8.21 percent in Louisiana in 2009.

Special skin care is non-routine care according to a resident care plan or physician's order, usually designed to prevent or reduce pressure ulcers of the skin. In 2004, 70.70 percent and in 2009, 77.89 percent of nursing facilities reported providing special skin care to residents, ranging from 45.14 percent in Oklahoma to 87.88 percent in Nebraska (See Table 18). Thus, as expected, the rate of such care is higher than the percent of actual pressure sores reported by facilities.

Rehabilitation and Other Special Treatments

Rehabilitation services are provided under the direction of a rehabilitation professional (physical therapist, occupational therapist, etc.) to improve functional ability. In 2004, 20.10 percent of residents in nursing facilities received such services and this was 25.72 percent in 2009 (See Table 19). These services varied from 14.32 percent of residents in Montana to 36.09 percent in Utah in 2009. These trends may have been related to changes in the Medicare prospective payment system for nursing facilities.

Ostomy care includes special care for a skin opening to the intestinal and/or urinary tract such as a colostomy (opening to the colon). Such care was provided to 4.2 percent of nursing facility residents in 2004 and increased to 4.67 percent in 2009 (See Table 19).

Injections and Intravenous Therapy

Injections are provided by facilities for a variety of medications. In 2004, 15.40 percent of residents in facilities were receiving injections compared with 21.31 percent in 2009 (See Table 20). The percent receiving injections ranged from 14.21 percent in Iowa to 25.73 percent in West Virginia in 2009.

Intravenous therapy and/or blood transfusions are used to provide fluid, medications, nutritional substances, and blood products for residents. The percent of residents reported receiving such therapy in nursing facilities was 2.4 percent in 2004 and 2.43 percent in 2009, with a range of 1.12 to 5.98 in the Connecticut and West Virginia respectively.

Tube Feeding

Tube feedings are sometimes used to provide nutritional substances to residents into the gastrointestinal system. Table 21 shows that in 2004, 6.2 percent of residents were receiving tube feedings compared with 5.48 percent in 2009. The percent varied from 1.23 percent in Wyoming to 13.9 percent in Hawaii in 2009.

Respiratory Therapy

Respiratory treatment is provided for respirators/ ventilators, oxygen, inhalation therapy, and other treatment. In 2004, 12.00 percent of facility residents received treatment compared to 14.72 percent in 2009 (See Table 21). Wyoming reported 32.74 percent of residents receiving respiratory treatment compared to 9.70 percent in Louisiana in 2009.

Urinary Incontinence and Bladder Training

Bladder or urinary incontinence more often than one time a week is a common problem in nursing facility residents. Table 22 shows that 53.6 percent of all residents were reported to have this problem in 2004 compared with 55.36 percent in 2009. This percentage ranged from 41.36 percent in Illinois to 68.86 percent in Maine in 2009.

Bladder training programs are designed to assist residents to gain control and maintain bladder control (such as by pelvic exercises or frequently toileting). Table 22 shows that the percent of residents with training programs in the U.S. ranged from 5.60 percent (in 2004) to 6.53 percent (in 2009). In 2009, the percent of facilities with toileting programs varied from 1.45 percent in Arizona to 30.09 percent in Maine. The discrepancy between the high percentage of residents with incontinence problems and the low percentage of training programs is notable.

Bowel Incontinence and Bowel Training

Bowel incontinence more often than one time a week was also a common problem of nursing facility residents. The prevalence of this problem ranged from 43.20 percent in 2004 to 43.49 percent in 2009 in the U.S (Table 23). The percent varied from 30.10 percent in Iowa to 60.54 percent in Hawaii in 2009.

Bowel training programs are also designed to assist residents to gain and maintain bowel control through the use of diet, fluids, and regular schedules. In the 2004-2009 period, 3.40 to 3.45 percent of residents in nursing facilities had such programs in the U.S (See Table 23). There was also a large discrepancy between the percent of residents with bowel incontinence and the percent of residents who were in training programs.

Catheters

Indwelling catheters are tubes used to drain urine from the bladder. In 2004, about 7.10 percent of facility residents were reported to be using catheters and this declined to 6.10 percent in 2009 (See Table 24).

STAFFING LEVELS

Background

There is agreement that there is a strong relationship between resident characteristics, nurse staffing time requirements, and nursing costs in nursing homes. Numerous studies have examined these relationships and it is this relationship which serves as the basis for the casemix reimbursement systems used in some states (Fries and Cooney, 1985; Fries et al., 1989; 1994; Schneider et al., 1988;).

Not surprisingly, higher staffing levels in nursing homes have been associated with higher quality of care. Nursing homes with more RN hours per patients were associated with positive outcomes such as being alive, having improved physically, being discharged to home, and higher quality of care on a number of measures. The positive relationship between staffing and improved nutrition have also been shown (Simmons & Schnelle, 2006). Harrington and colleagues (2000b) found a relationship between more RNs and fewer deficiencies. Castle & Engberg (2007) examined the relationships between staffing and quality measures. Bostick, Rantz, Flesner, & Riggs (2006) and Collier and Harrington (2009) have reviewed some of the many studies on the positive relationship between staffing and nursing home quality.

The evidence from these studies recently led the Institute of Medicine Committee on Nurse Staff in Hospitals and Nursing Homes (1996) to conclude that the preponderance of evidence from a number of studies with different types of quality measures shows a positive

relationship between nursing staffing and quality of nursing home care. In 2001, the IOM again found a relationship between low staffing levels and poor quality of care in some facilities. Recent reports recommend that minimum staffing levels are needed to ensure quality of care (Harrington et al., 2000a; HCFA, 2000). An expert panel recommended minimum staffing levels of 4.55 hours per patient day, (Harrington et al., 2000a) including all RNs, LVNs, and nursing assistants. See also recommendations by the National Citizens Coalition for Nursing Home Reform (1995). The Institute of Medicine (IOM, 2001) also recommended improving the minimum staffing standards and adding RNs 24 hours per day.

More recently, the Centers for Medicare and Medicaid Services (CMS, 2001) reported that facilities with staffing levels below 4.1 hours per resident day for long stay residents may provide care that results in harm and jeopardy to the residents. A study by Schnelle and colleague (2004) also supports a threshold level of 4.1 total nursing hours per resident day to ensure that the processes of nursing care are adequate.

The Institute of Medicine's 2004 report on Keeping Patient's Safe recommended that CMS adopt minimum staffing standards for nursing homes based on the recommendations in the CMS 2001 report.

The level of registered nurse staffing is a growing concern for quality of care

because of controls on Medicaid and Medicare reimbursement rates may have negative effects on staffing levels (Swan et al., 2000; IOM, 2001). Grabowski and colleagues have shown the relationship between low Medicaid reimbursement rates and low staffing and poor quality (2001; 2004; 2004). Harrington and colleagues (2006) found that although Medicaid reimbursement rates were related to higher staffing, minimum state staffing standards were a stronger predictor of higher staffing levels.

Nursing personnel in nursing facilities were of particular interest for this report. Nursing personnel included: registered nurses (RNs); licensed practical/vocational nurses (LPN/LVNs), and nursing aides/orderlies/ assistants (NAs). Staffing hours (including full-time, part-time, and contract staff) are reported by facilities as total hours worked in a fourteen day period. Nursing personnel hours are examined for each of the above three categories separately, for all licensed nursing personnel (RNs and LPN/LVNs combined), and for total nursing personnel (RNs, LPN/LVNs, and NAs). The staff time includes all administrative and direct care time.

To compute the staffing ratios for this report, the total number of staffing payroll hours reported in a two-week period was divided by the total number of residents and by the 14 days in the reporting period. In examining the staffing data, there were some facilities that reported very high or low levels of staffing. In order to minimize the number of facilities that may have reported erroneous data, we developed standard rules to remove these facilities from the data set. A conservative approach was taken by eliminating the

lower one percent of facilities and the upper 2 percent. (See the appendix).

Nursing facilities are required by regulation to meet minimum nursing standards. Facilities must have sufficient nursing staff to provide nursing and related services to attain or maintain the highest practicable physical, mental, and psychosocial well-being of residents. Facilities must also provide sufficient numbers of licensed nursing personnel to provide care on a 24 hour basis to all residents in accordance with resident care plans.

Facilities must also use the services of a registered nurse for at least 8 consecutive hours a day, 7 days a week, except when they have been given a waiver. A Medicare-only skilled nursing facility may have a waiver if it is located in a rural area and has one registered nurse who is on duty 40 hours a week. Waivers may also be granted under certain conditions where there is a shortage of appropriate personnel and where the health and safety of individuals is not jeopardized.

For this report, the total hours of staffing per resident day were examined separately for dually certified facilities (Title 18/19), for Medicare-only facilities (Title 18), and for Medicaid-only facilities (Title 19). It should be noted that the reported staffing ratios reflect reported hours per resident day and not the actual hours of care delivered directly to residents. These data are reported by each facility for the two weeks prior to the facility survey.

Facilities with Medicaid Only and Medicare and/or Medicaid Beds (Title 19 and Title 18/19)

Tables 25 and 26 show the total facilities with Medicaid-only and Medicare/Medicaid beds in the U.S. for the 2004 through 2009 period. The number of facilities varied by year and category because missing and erroneous data that were removed, using consistent procedures over the time period. There were 14,002 facilities reporting beds in this category for RNs in 2009.

Registered Nursing Hours

The average RN hours per resident day are shown in Table 25. The average hours slightly increase from 0.50 in 2004 to 0.60 in 2009 or a 20 percent increase. This converts to 36 minutes per resident day or about 12 minutes per 8 hour shift in 2009. The average ratio of RNs hours ranged from 0.34 hours (in Louisiana) to 1.47 hours (in Alaska) in 2009. This includes nurses who are in administrative positions.

LPN/LVN Nursing Hours

The average LPN/LVN hours per resident day are shown in Table 25. LPN/LVN hours increased by 13 percent (42 minutes) in 2004 to .79 hours per resident day (or 47.4 minutes per shift) in 2009.

Nursing Aide/Assistant Hours

The average NA hours per resident day are shown in Table 25. The average was 2.3 hours (138 minutes) in 2004. In 2009, the average NA hours increased to 2.38 hours (143 minutes per resident day or 48 minutes per shift).

Licensed Nursing Hours

Table 26 shows the average licensed nursing hours (RNs and LPN/LVNs) per resident day increased from 1.2 hours in 2004 to 1.39 in 2009 (16 percent). This was about 83.4 minutes per resident day or 27.8 minutes per 8-hour shift in 2009.

Total Nursing Hours

The total nursing hours (RNs, LPN/LVNs, and NAs) per resident day increased from 3.5 in 2004 to 3.76 in 2009 (7 percent; See Table 26) primarily because of the increase in unlicensed hours. The total nursing hours varied across states from 3.36 in Illinois to 5.45 in Alaska in 2009.

Facilities with Medicare Only Certified Beds (Title 18)

Tables 27 and 28 show the certified facilities with Medicare only beds. In 2009 there were a total of 713 such facilities that had RN staffing data available. Medicare only certified nursing facility beds represented only 2.10 percent of the total nursing facility beds (Table 5).

Registered Nursing Hours

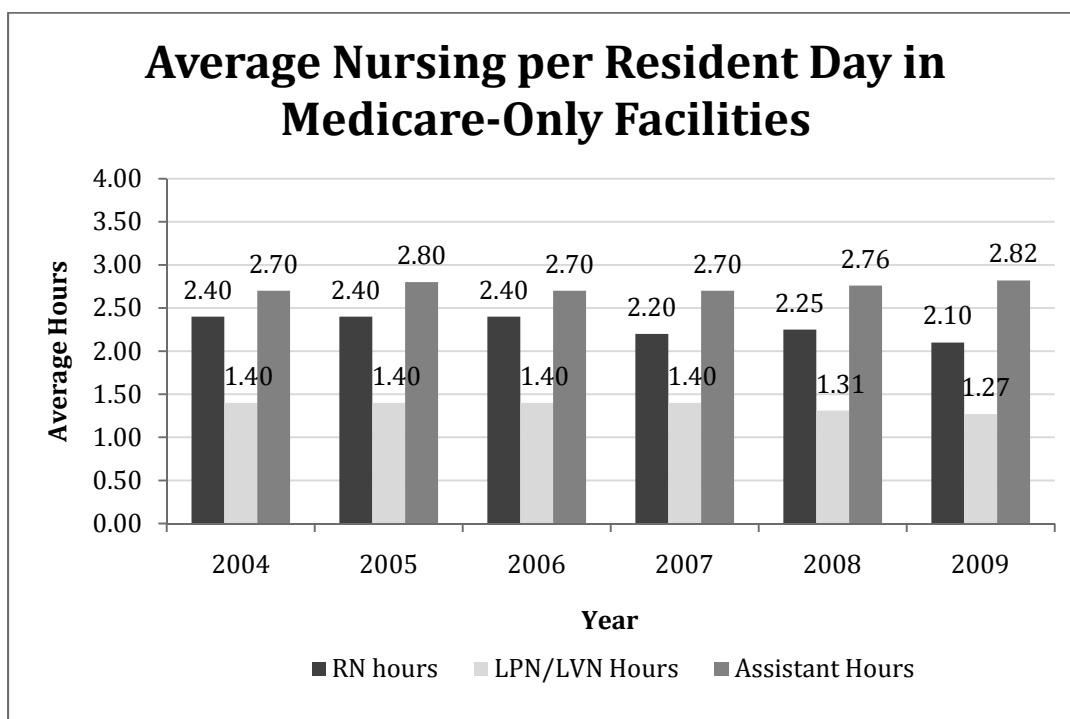

The average RN hours per resident day are shown in Table 27. The average RN hours were 2.4 in 2004 and then decreased to 2.10 hours (126 minutes) per resident day in 2009. This was a 12.5 percent decrease in RN hours per resident day since 2004. The ratio of RN hours varied across states.

LPN/LVN Nursing Hours

The average LPN/LVN hours per resident day are shown in Table 27. There was an average of 1.4 hours per resident day in 2004 and this decreased to 1.27 in 2009. This was a 9.29 percent decrease in LPN/LVN hours per resident day. This was about 76.2 minutes per resident day or 25.4 minutes per 8 hour shift in 2009.

Nursing Aide/Assistant Hours

The average NA hours per resident day are shown in Table 27. The average was 2.7 hours in 2004 and 2.82 hours in 2009.

Licensed Nursing Hours

Table 28 shows that the average licensed nursing hours (RNs and LPN/LVNs) per resident day was 3.8 in 2004 and declined to 3.32 for a 13 percent drop in 2009. The ratio varied across states.

Total Nursing Hours

Table 28 shows that the total nursing hours (RNs, LPN/LVNs, and NAs) per resident day was 6.1 in 2004 and then declined to 6.12 hours in 2009. The total hours varied across states

Facilities with Medicaid-Only Certified Beds (Title 19)

Tables 29 and 30 show facilities with Medicaid-only beds. In 2009, there were a total of 583 such facilities that had RN staffing data available. Medicaid-only nursing facilities represented only 2.80 percent of the total nursing facilities in 2009 (Table 5).

RN Hours

The average RN hours per resident day are shown in Table 29. In 2004, the average RN hours were 0.5 and these increased to 0.57 in 2009. The ratio of RNs hours varied across states.

LPN/LVN Hours

The average LPN/LVN hours per resident day are shown in Table 29. The average LPN/LVN hours were 0.6 in 2004 and increased to 0.71 in 2009. The ratio of LPN/LVN hours varied across states.

Nursing Aide/Assistant Hours

The average NA hours per resident day are shown in Table 29. The average NA hours were 2.3 in 2004 and increased to 2.44 by 2009 (or by 6.1 percent). The ratio of NA hours varied across states.

Licensed Nursing Hours

Table 30 shows that the average licensed nursing hours (RNs and LPN/LVNs) per resident day in Medicaid only facilities were 1.1 in 2004 and 1.28 in 2009. The average hours varied across states.

Total Nursing Hours

Table 30 shows that the total nursing hours (RNs, LPN/LVNs, and NAs) per resident day were 3.4 in 2004 and 3.71 in 2009 (a 9.1 percent increase). The total hours varied across states.

Total Certified Facilities (Title 19, Title 18/19, and Title 18)

Table 31 and 32 shows a combined total of about 14,030 to 14,625 facilities (with Title 19, Title 18/19, and Title 18 only beds) that had useable staffing data for the staffing analysis in 2009.

Registered Nursing Hours

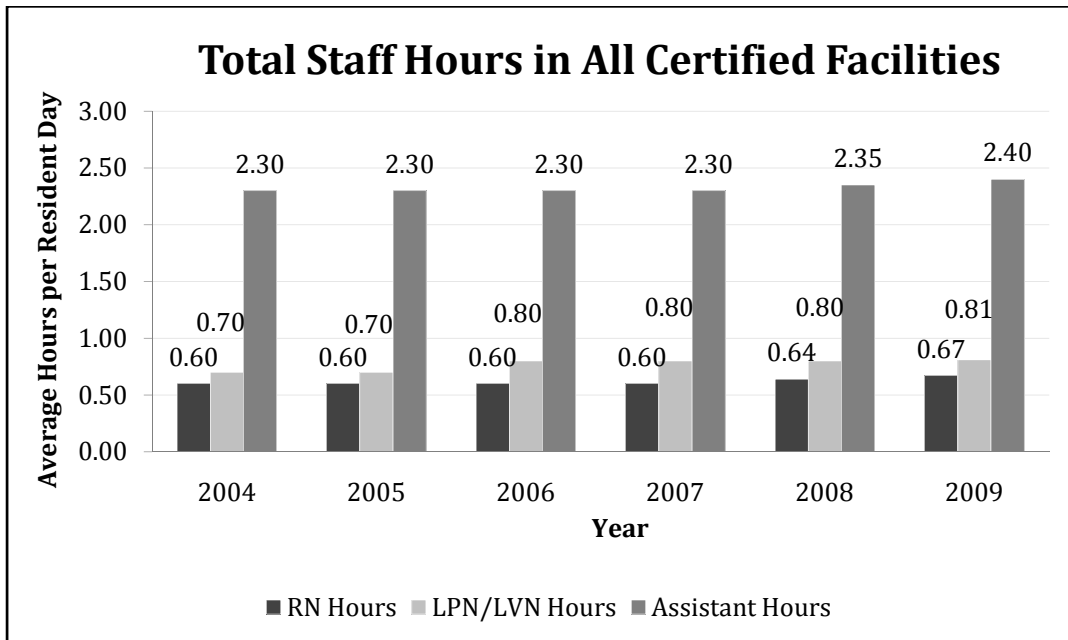

The average RN hours per resident day are shown in Table 31. The average hours were 0.6 in 2004 and then increased to 0.67 during 2009. In 2009, this was 40.2 minutes per resident day or 13.4 minutes per 8 hour shift. This table shows that nursing assistant hours are partially being substituted for RN hours.

LPN/LVN Nursing Hours

The average LPN/LVN hours per resident day are shown in Table 31. There were an average of 0.7 hours per resident day in 2004, and increased to 0.81 in 2009. In 2009, this represents 48.6 minutes per resident day or 16.2 minutes per 8 hour shift.

Nursing Aide/Assistant Hours

The average NA hours per resident day are shown in Table 31. The average was 2.3 hours during in 2004, and increased to 2.4 in 2009. This was 144 minutes per resident day or 48 minutes per 8 hour shift in 2009.

Licensed Nursing Hours

Table 32 shows the average licensed nursing hours (RNs and LPN/LVNs) per resident day was 1.40 in 2004 and 1.49 in 2009.

Total Nursing Hours

Table 32 shows the total nursing hours (RNs, LPN/LVNs, and NAs) per resident day was 3.7 hours per resident day in 2004 and this increased to 3.88 hours per resident day in 2009, a 5 percent increase. In 2009, this was about 232.8 minutes per resident day or 77.6 minutes per 8 hour shift.

FACILITY DEFICIENCIES FROM STATE SURVEY EVALUATIONS

Background

Nursing facilities provide care to prevent problems or to address resident problems with cognition, communication/hearing, vision, physical functioning, continence, psychosocial functioning, mood and behavior, oral/ nutritional and dental care, skin condition, and medications.

A number of clinical process measures have been associated with poor patient outcomes. These include urethral catheterization, physical restraints, and tube feedings. Another common problem in nursing homes is the improper use of psychotropic drugs identified in a number of studies.

An outcome is an evaluation of the impact of facility care on a resident, whereas a process indicator is services or activities which a facility does or does not provide. A number of quality outcomes have been identified, such as: pressure ulcers, falls, weight loss, and infectious disease. Other negative outcomes are behavioral/ emotional problems, cognitive problems, pressure ulcers, and deterioration in physical functioning (Zimmerman et al., 1995).

State surveyors assess both the process and the outcomes of nursing home care in 15 major areas. Each of these areas has specific regulations which state surveyors review to determine whether or not facilities have met the standards. In July 1995, HCFA consolidated the 325 measures of quality to about 185 measures. This report shows data for 1996 through 2002 using the 185 consolidated measures.

Of the total survey requirements, most are considered process indicators and some are outcome measures. The process measures include whether proper procedures are used in providing each of the major nursing home services. The outcome measures include ensuring that negative problems do not occur such as: residents without an indwelling catheter are not catheterized; residents do not experience a reduction in range of motion; residents able to eat alone/with assistance are not fed by naso-gastric tube; and residents maintain acceptable parameters of nutritional status.

Where a facility fails to meet a standard, a deficiency or citation is given to the facility for that individual standard. The deficiencies are given for problems which can result in a negative impact on the health and safety of residents. Beginning in July 1995, HCFA surveyors also rate each deficiencies based on scope and severity for purposes of enforcement.

The deficiencies rated as causing actual harm or immediate jeopardy are the most serious (rated at a G level or higher). The overall deficiency data on process and outcome measures from OSCAR are limited to whether or not the facility meets each of the minimum standards. Since there are many survey measures (or items), only a selected number of these are presented in the report. The measures with the highest percent of facilities with deficiencies were examined.

Each table shows an identifying number (F-tag) and a short description of each standard or item. A detailed list of all the F-tags and longer descriptions are shown in the last table. Definitions of deficiencies are given in the State Operations Manual published by the Centers for Medicare and Medicaid Services.

Changes were made in some of the deficiency categories by the Centers for Medicare and Medicaid Services. Two new items were requirements were added and several requirements were combined. These changes were taken into account in the data book for 2006 and these requirements were then revised for the previous years, as follows:

F315 and 316 were combined into F315, Urinary Incontinence Care

F329, F330 and F331 were combined into F329, Unnecessary Drugs.

F334, Influenza/Pneumococcal Immunizations became a new requirement.

F355, Nursing Waivers is a new item (there were none for 2006)

F356, Posting Nurse Staff Information was new

F425, F426, and F427 were combined into F425, Pharmacy Services

F428, F429, F430 were combined into F428, Drug Regimen Review
F431 and F432 were combined into F431, Consultation, Labeling and Storage

In 2007, accident prevention (F324) was combined with accident environment (F323).

Nevertheless, as noted earlier, the IOM (2001) recommended that CMS strengthen the survey and the enforcement process to achieve greater uniformity across states and to encourage facilities to comply with federal standards. The US GAO (2004; 2004) and the Inspector General (2004) continue to recommend improvements in enforcement and standardization of the survey and enforcement process.

Earlier versions of this report included only deficiencies from the annual licensing and certification surveys. In 2009, the report was revised to include deficiencies from both the annual surveys and complaint investigations. The report findings were then revised for each year from 2004 through 2009.

FINDINGS

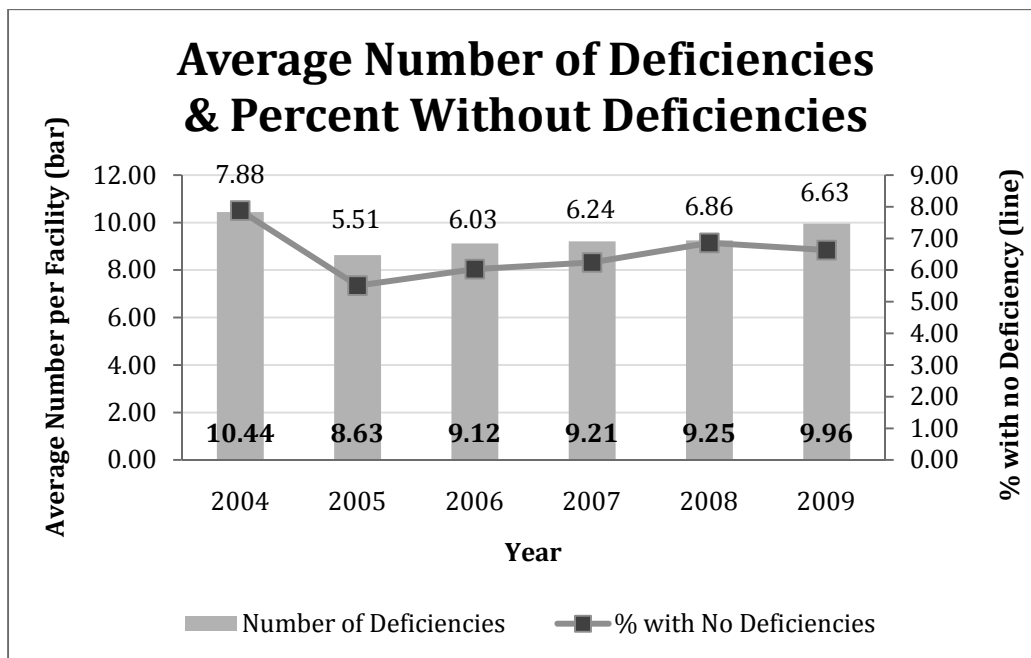

DEFICIENCIES FROM QUALITY OF CARE EVALUATION

Average Number of Deficiencies per Certified Nursing Facility

Table 33 shows the U.S. average number of deficiencies per facility was 10.44 deficiencies per facility in 2004 and increased to 9.96 in 2009. In 2009, the average number of deficiencies varied substantially across the states (from 5.73 in North Carolina to 22 in Washington DC).

Percent of Facilities with No Deficiencies

The percent of facilities reporting no deficiencies in the U.S. fluctuated, but was 7.88 percent in 2004 and 6.63 in 2009 (See Table 33). The percent of facilities with no deficiencies varied by state from 0 percent in Alaska up to 18.33 percent in Massachusetts in 2009.

Percent of Facilities Receiving a Deficiency for Actual Harm or Immediate Jeopardy

Beginning in July 1996, surveyors rated the scope and severity of each deficiency. Table 34 shows the percent of facilities that received one or more deficiencies that caused harm or immediate jeopardy to residents (rated as a G-level deficiency or higher). The average percent was 23.85 in 2004, and was 24.67 in 2009.

Percent of Facilities Receiving Substandard Deficiencies

Deficiencies that constitute substandard care are those that have a scope and severity that are rated as having a wide-spread impact with the potential for harm or jeopardy or those that had a pattern of widespread actual harm or cause immediate jeopardy (rated as F, H, I, J, K or L) for any of the following areas: resident behavior and nursing home practices, quality of life, or quality of care.

In 2004, 5.4 facilities had one or more deficiencies that were in the category of substandard deficiencies. This increased to 7.34 percent of facilities in 2009 – a 36 percent increase.

Top Ten Deficiencies for Certified Facilities in 2009

The top ten most frequently cited deficiencies in the U.S. in 2009 are shown by state on Table 36. The categories with the highest number of deficiencies were given for failures in accident environment (45.43 percent); food sanitation (39.68 percent); quality of care (35.50 percent); professional standards (33.73 percent); and comprehensive care plans (29.10 percent).

Top Ten States Citing the Top Deficiencies in 2009

Table 36 also shows the top ten states in terms of the number of deficiencies, which were issued to nursing facilities for each of the top 10 deficiencies (See states with asterisks). In 2009, District of Columbia had 8, the state with the most deficiencies in the top ten deficiency categories.

* The ten states in which the highest percentage of facilities had deficiencies.

Selected Deficiencies by State

The following is a presentation of selected deficiencies by state and year. These are presented in the order of the deficiency groups on the survey forms and not based on the number of deficiencies cited. These data show trends over time by state.

Physical Restraints (F221)

Residents have the right to be free of physical restraints imposed for purposes of discipline or convenience and not required to treat the resident's medical symptoms. Restraints are defined as mechanical devices, materials, or equipment that restricts freedom of movement or normal access to one's body. In 2004, 9.92 percent of facilities received deficiencies for this category. Restraint deficiencies increased to 10.78 percent in 2009 (See Table 37).

Dignity (F241)

Facilities must promote care for residents in a manner and in an environment that maintains or enhances dignity and respect in full recognition of his or her individuality. This involves assisting residents to be well groomed, dress appropriately, promote independence in dining, allowing private space and property, speaking and listening respectfully, and focusing on the individual's communication. In 2004, 16.29 percent of facilities received deficiencies and increased to 20.35 percent in 2009 (See Table 38).

Activities Program (F248)

Facilities must provide residents with ongoing activities that meet the interests and the physical, mental, and psychosocial well-being needs of each resident. In 2004, 6.37 percent of facilities in the U.S. were given deficiencies in this category while 7.84 percent received deficiencies in 2009 (See Table 39).

Housekeeping (F253)

Housekeeping and maintenance services must be provided to maintain a sanitary, orderly, and comfortable environment. In 2004, 19.09 percent of facilities received deficiencies for failing to meet this requirement, which increased to 21.15 in 2009 (See Table 40).

Activities of Daily Living Services (F312)

Residents who are unable to carry out activities of daily living (ADL) should be given the necessary services to maintain nutrition, grooming, and personal and oral hygiene. In 2004, 12.99 percent of facilities were given deficiencies for this violation compared with 14.95 percent of facilities in 2009 (See Table 41).

Pressure Sores (F314)

Facilities must ensure that residents without pressure sores do not develop them if it is avoidable. In 2004, 16.88 percent of facilities received deficiencies for failing to meet this standard (See Table 42). Although violations for pressure sores have fluctuated since 2004, the percent of facilities cited for this violation was 21.16 in 2009.

Bladder Incontinence Care (F315)

Residents who have bladder incontinence should receive appropriate treatment and services to prevent incontinence and to restore as much bladder functioning as possible. In 2004, 13.09 percent of facilities received deficiencies for this standard compared with 20.42 percent in 2009 (See Table 43).

Limited Range of Motion Services (F318)

Residents with limited range of motion must receive appropriate treatment and services to increase their range and/or to prevent declines in range of motion. In 2004, 6.64 percent of facilities received deficiencies for violating this requirement. The percent of facilities with deficiencies decreased to 7.35 percent in 2009 (See Table 44).

Accident Environment (F323)

Facilities must ensure that the environment is as free of accident hazards as possible. This is designed to prevent unexpected and unintended injury. In 2004, 20.85 percent of facilities received deficiencies for failing to meet this standard (See Table 45). In 2007, the percent of facilities that received deficiencies for this requirement sharply increased to 43.13, and slightly increased again in 2009 to 45.43 percent. The sharp increase was the result of combining F323 and F324 into one category of F323 in 2007.

Nutrition (F325)

Facilities must ensure that residents receive acceptable nutrition to maintain body weight unless a resident's condition makes this impossible. In 2004, 7.46 percent of facilities failed to meet this standard compared with 10.72 percent in 2009 (See Table 46).

Sufficient Nursing Staff (F353)

Facilities must have sufficient nursing staff to provide nursing and related services to attain or maintain the highest practicable physical, mental, and psychosocial well-being of residents. In 2004, 3.03 percent of facilities were given deficiencies for failing to meet this requirement compared with only 2.84 percent in 2009 (See Table 47). These low deficiency rates are a concern considering that the CMS (2001) report found that 9 out of 10 facilities have inadequate staffing.

Food Sanitation (F371)

Sanitary conditions must be ensured in storing, preparing, distributing, and serving food to prevent food borne illness. In 2004, 31.44 percent of facilities were given deficiencies for failure to meet this regulation compared to 39.68 percent in 2009 (See Table 48).

PERCENT OF NURSING FACILITIES IN THE U.S. WITH DEFICIENCIES BY SURVEY CATEGORY

Percent of Deficiencies

This section presents a listing of about 185 survey items for each survey category based on the federal survey requirements (excluding the life safety requirements). The percent of facilities in the U.S. with deficiencies are presented for the 2004-2009 period.

Resident Rights

In this category of survey items, the highest percent of deficiencies were given for failure to give notice of changes (See Table 49). Only 8 of the 26 items in this category were cited in 2 percent or more of the facilities in the U.S. in 2009.

Admission, Transfer, and Discharge Rights

In this category of survey items, the most deficiencies were given for failure to provide notice of facility policies and to provide notice before transfer, although few deficiencies were given in this category (See Table 50). In 2009, 2 items in this category, Notice of Policies and Notice Before Transfer, was cited in more than 1 percent of the facilities in the U.S.

Resident Behavior and Facility Practices

In this category of survey items, the highest percent of deficiencies were given for unemployable individuals (17.56 percent). In addition, 15.54 percent were cited for failure to follow policies and procedures for staff; and 10.78 were given citations for improper physical restraints (See Table 50).

Quality of Life

Most deficiencies were issued to facilities for poor housekeeping (21.15 percent in 2009) and for failure to maintain the dignity of residents (20.35 percent in 2009). Failure to accommodate needs, failure to provide adequate social services, and failure to provide an adequate activities program were also frequently cited (See Table 51). Seven of the 19 items in this category were cited in 2 percent or more of the facilities.

Resident Assessment

In 2009, most deficiencies were issued to facilities for failure to meet professional standards (33.73 percent), failure to provide comprehensive care plans for residents (29.10 percent), failure to provide for qualified personnel (16.64 percent), failure to make comprehensive assessments (16.12 percent) and failure to meet plan requirements (15.30 percent) (See Table 52). Eight of 15 items in this category were cited in 2 percent or more of facilities.

Quality of Care

The quality of care category contained a number of important items that were given citations. The failure to keep the environment as free of hazards that cause accidents (including accident prevention) (F323) was cited in 45.43 percent of facilities in 2009 (Table 53). General quality of care was a deficiency in 35.50 percent of facilities in 2009, which had increased from 31.03 percent in 2004. Failure to prevent pressure sores and use of unnecessary drugs were deficiencies in 21.16 and 23.80 percent of the facilities in 2009. Sixteen out of the 22 items in this category were cited in 2 percent or more of the facilities in the U.S.

Nursing Services

Nursing services are key to quality of care in nursing facilities. Of the facilities given deficiencies, 3.03 percent of facilities were given deficiencies for insufficient staff to provide appropriate care in 2004 compared to 2.84 percent in 2009 (a 6 percent decrease). The number of deficiencies for inadequate registered nurse staffing increased from 2.00 percent in 2004 to 1.58 in 2009, a 21 percent decrease (Table 54).

Dietary Services

In 2009, 39.68 percent of facilities were given deficiencies for inadequate food sanitation while 8.75 percent received citations for inadequate food, 7.38 for nutritionally inadequate menus, and 3.43 inadequate therapeutic diets (Table 54).

Physician Services

Few nursing facilities were given deficiencies for physician services. In 2009, 3.58 percent received deficiencies for inadequate frequency of visits and 2.89 percent received deficiencies for inadequate physician visits (Table 55).

Rehabilitative Services

In 2009, 1.65 percent of facilities were given deficiencies for inadequate rehabilitative services (Table 55).

Dental Services

Fewer facilities (less than two percent) were given deficiencies for poor dental services than for other types of professional services in the 2004 to 2009 period (Table 55).

Pharmacy Services

In 2009, 18.63 percent of facilities received deficiencies for improper consultation, labeling, and storage of drugs, 16.38 percent of facilities received deficiencies for failure to provide proper pharmacy services, and 10.71 for failure to review drug regimens (Table 56). All pharmacy categories were cited in more than 2 percent of facilities in 2009.

Infection Control

Infection control is an important category. In 2004, 15.61 percent of facilities received deficiencies for inadequate infection control, compared to 30.43 percent in 2009 (Table 56). In addition, 9.94 percent had deficiencies for inadequate hand washing.

Physical Environment

The category for physical environment includes 16 requirements. In 2009, 13.07 percent of facilities received deficiencies for other inadequate environmental conditions, and 5.12 percent for inadequate space and equipment (Table 57). Other facilities received deficiencies for inadequate resident call systems (4.41 percent), inadequate pest control (3.23 percent), and inadequate room space (2.68 percent).

Administration Services

In 2009, 5.48 percent of facilities received deficiencies for failure to demonstrate the proficiency of nursing assistants, 4.22 percent for failure to comply with laws, 3.12 percent for ineffective administration, and 2.48 percent for inadequate inservice education (Table 58). Four of the 12 administrative requirements were cited in more than 2 percent of facilities in 2009.

Laboratory Services

In 2009, only two of the 8 laboratory services requirements were cited in more than 2 percent of facilities. These deficiencies were for failure to provide high quality, timely laboratory services (7.68 percent in 2009) and inadequate physician notification (2.04 percent in 2009).

Other Activities

Three of the 8 other activities requirements were cited in more than 2 percent of facilities in 2009. These deficiencies were issued for inadequate clinical record keeping (22.35 percent), failure of the quality assurance committee to meet requirements (5.04 percent), and inadequate emergency training (3.86 percent).

SUMMARY

In summary, this report has provided information on nursing facilities in the states. The data are from the federal OSCAR system which provides comprehensive information about facility characteristics, resident characteristics and services provided, staffing, and deficiencies from federal surveys. The federal survey findings can be expected to change over time as policies are implemented to encourage

improvements in the quality of nursing care.

This is one of the few reports which has been able to provide historical data on nursing facilities. The overall trend lines are fairly stable over time for most of the items. Thus, these data provide an opportunity to examine quality issues and deficiency patterns over time.

TECHNICAL NOTES

Data Sources

The OSCAR system includes data for all certified nursing homes in the U.S. The data are collected in three separate sets of files: (1) provider information, which include facility characteristics and staffing data; (2) health survey file (with facility-level summary information regarding resident characteristics); and the (3) survey deficiencies. In addition to the OSCAR data for annual surveys, data from OSCAR complaint files were combined with the annual survey data. OSCAR is an on-line data system from the Centers for Medicare and Medicaid Services (CMS). The OSCAR data for this report included the most recent surveys for all facilities for the period of 2004-2009.

All nursing facilities federally certified for Medicare (skilled nursing care) and Medicaid (nursing facilities) and surveyed during the calendar year were included (about 15,100 facilities) in these data. Intermediate care facilities for the mentally retarded (ICF-MR) were excluded because they use different federal certification forms and have different standards of care. Facilities located in the trust territories and Puerto Rico were excluded.

Data Cleaning and Duplicate Records

In preparing the data for this report, discussions were held with HCFA officials as necessary to discuss data acquisition, formatting, and cleaning issues. Frequency distributions were developed for all the indicators on the data set and a series of cleaning activities undertaken.

The first step in cleaning was to eliminate any duplicate provider records. Duplicate records were considered generally to be the result of changes in certification for Medicare and Medicaid (Title 18/19) facilities or Medicare only (Title 18) facilities. Since 1990, because of OBRA 1987 legislation, Medicaid only (Title 19) SNF and ICF facilities are certified together as nursing facilities (NFs). With this change, some problems with duplicate SNF and ICF reporting were essentially eliminated.

To correct the duplicate problems, we identified all those facilities showing identical values for the following areas: state, city, facility name, and facility address. Where duplicate records were identified, a decision-making procedure was invoked as follows:

- (1) The most recent record within a calendar year was selected over earlier records; and
- (2) A record reporting a category of either: (01) skilled nursing facility (SNF) -- Medicare participation; (02) nursing facility (NF) -- Medicaid participation; or (03) SNF/ICF -- Medicare/Medicaid participation was selected over facilities reporting as (10) hospital based.

For those remaining facilities with the same name and/or address, data on telephone numbers and survey data were then examined. Where there appeared to be two facilities at one site with different data, neither facility was eliminated. This overall process resulted in dropping about 100 facilities annually.

Data Errors

The data were examined for missing values and gross errors. Means and standard deviations of the data were computed and examined. Logic checks confirming the reasonableness of data were conducted. Preliminary work identified some missing data and errors, primarily in reporting the beds, staffing and the number of residents. Each problem area, and the cleaning procedures, are discussed below.

Total Number of Beds

During the preliminary work, the total number of beds in each state reported on OSCAR was compared to the total licensed bed supply for each state from an independent survey of states (DuNah et al. 1994). The total number of beds reported by facilities was significantly higher than the total licensed beds in the U.S. An analysis of this discrepancy found that some hospital-based facilities had reported the total number of acute care beds rather than the total number of skilled nursing beds for their facility. To correct this error, the maximum number of beds for a hospital-based facility was set to equal the maximum number of certified skilled nursing beds in the facility. Thus, this process made the total certified nursing facility beds more comparable to the total state licensed nursing facility beds in each state.

Total Number of Residents

Several problems concerning resident data were detected. First, some facilities had missing data for their total number of residents. These facilities were left in the data set, but where resident data were not available, these facilities were not included in the tables report.

Second, some facilities reported extremely low numbers of residents. In order to identify facilities with possible errors in reporting residents, occupancy rates were computed for all nursing facilities. Free-standing (non-hospital based) facilities reporting 50 or less residents than total beds were considered to have erroneous data and were eliminated from the staffing and resident characteristics' analysis.

Third, some facilities reported more residents than beds, suggesting more than 100 percent occupancy. Hospital-based facilities may have had approval for swing beds which would allow the hospital to use an acute care bed for a nursing home resident. Therefore, hospital-based facilities with more residents than beds were left in the data set, but the maximum occupancy rate for such facilities was reported to be 100 percent. Finally, facilities with numbers of residents reported at greater than 100 percent of total beds, which were not hospital-based, were dropped from the analysis.

Staffing Data

Frequencies for hours of staffing per resident day were examined separately for Medicaid only facilities and for Medicare only and/or dually certified facilities. The total number of hours of staff reported in a two week period was divided by the total number of residents and by the 14 days in the reporting period.

There were a number of problems identified with the facility staffing data. Some facilities reported extremely high staff hours per resident day while others reported no registered nurses or no nursing staff hours. Where a facility reported nurse staffing hours per resident day which did not fall within a reasonable range, the data for that item were be considered invalid. The following uniform decision-making rules were created for eliminating facility staffing data which clearly appeared to be too high or too low:

First, facilities with average nursing hours per resident day that were greater than 24 hours of nursing per resident were considered erroneous and eliminated from the analysis. Distributions of the nursing hours per resident were then examined.

To correct further for staffing levels that were unreasonably high, facilities reporting staffing hours per resident day in the upper 2 percent by type of facility (separately for Medicaid only and for Medicare only/dually certified) and by type of staff (RN, LVN/LPN, and nursing assistants) were eliminated from the staffing analysis.

Facilities reporting extremely low staffing hours per resident day were identified. Since some Title 19 facilities and Title 18/19 facilities were given HCFA waivers from the staffing requirements, these facilities may have few or no RN staff.

Since all facilities are required to have some licensed nurses, nursing facilities with no licensed staff (RNs and/or LVN/LPNs) and/or no nursing staff were eliminated from these analyses. In addition, facilities with computed staffing levels in the lower 1 percent range for licensed or combined nursing personnel for each type of facility (separately for Medicaid only and for Medicare only and/or dually certified) were removed from the staffing report because some of these may have been erroneous.

Other reporting errors in staffing data may occur. For example, facility errors in the reporting of time periods may have occurred or rounding errors may have occurred. These types of errors cannot be detected in the data set. Thus, because further accuracy checks could not be conducted, only the high and low outlier facilities were removed from the tables on staff.

RNs, LPN/LVNs, and Aides are presented separately. Total licensed nurses are also presented; these include RNs and LPN/LVNs added together. Total combined nursing personnel are included as combined RNs, LPN/LVNs, and nursing aide hours.
